CSE 2431   **lab2**   **Spring 2017**
Due: Monday, February 27th, 2017, 11:59 p.m.

1. Goal

This lab assignment is based on the project given in Chapter 5 with slight modification and more helpful information. For the cited figures/sections, you need to refer to the corresponding part in the textbook.

2. Introduction

In this project, we will design a programming solution to the bounded-buffer problem using the producer and consumer processes shown in Figure 5.9 and Figure 5.10. The solution presented in Section 5.7.1 uses three semaphores: *empty* and *full*, which count the number of empty and full slots in the buffer, and *mutex*, which is a binary (or mutual exclusive) semaphore that protects the actual insertion or removal of items in the buffer. Standard counting semaphores will be used for *empty* and *full*, and, rather than a binary semaphore, a mutex lock will be used to represent *mutex*. The producer and consumer - running as separate threads - will move items to and from a buffer that is synchronized with these *empty*, *full*, and *mutex* structures. Using C, you are required to use the pthread package to solve this problem in this project.

3. The Buffer

Internally, the buffer will consist of a fixed-size array of type buffer_item (which will be defined using a *typedef*). The array of *buffer_item* objects will be manipulated as a circular queue. The definition of buffer_item, along with the size of the buffer, should be stored in a header file such as the following:

/* buffer.h */
typedef int buffer_item;
#define BUFFER_SIZE 5

The buffer will be manipulated with two functions, insert_item() and remove_item(), which are called by the producer and consumer threads, respectively. A skeleton outlining these functions appears as:

```
#include "buffer.h"

/* the buffer */
buffer_item buffer[BUFFER_SIZE];

int insert_item(buffer_item item) {
        /* insert an item into buffer */

        printf ("producer produced %d\n", item);

        /* return 0 if successful, otherwise
           return -1 indicating an error condition */
}

int remove_item(buffer_item *item) {
        /* remove an object from buffer and place it in item*/

        printf("consumer consumed %d\n", rand);

        /* return 0 if successful, otherwise
           return -1 indicating an error condition */
}
```

The *insert_item*() and *remove_item*() functions will synchronize the producer and consumer using the algorithms outlined in Figure 5.9 and 5.10. The buffer will also require an initialization function that initializes the mutual exclusive object *mutex* along with the *empty* and *full* semaphores.

The *main*() function will initialize the buffer and create the separate producer and consumer threads. Once it has created the producer and consumer threads, the *main*() function will sleep for a period of time and, upon awakening, will terminate the application. The *main*() function will be passed three parameters on the command line:

1. How long to sleep before terminating.
2. The number of producer threads.
3. The number of consumer threads.

A skeleton for this function appears as:

```
#include "buffer.h"

int main(int argc, char*argv[]) {
        /* 1. Get command line arguments argv[1], argv[2], argv[3] */
        /* 2. Initialize buffer, mutex, semaphores, and other global vars */
        /* 3. Create producer thread(s) */
```

/* 4. Create consumer thread(s) */
/* 5. Sleep */
/* 6. Release resources, e.g. destroy mutex and semaphores */
/* 7. Exit */
    }

4. **Producer and Consumer Threads:** The producer thread will alternate between sleeping for a random period and inserting a random integer into the buffer. Random numbers will be produced using the rand_r(unsigned int *seed) function, which produces random integers between 0 and RAND_MAX safely in multithreaded processes. The consumer will also sleep for a random period of time and, upon awakening, will attempt to remove an item from the buffer. An outline of the producer and consumer threads appears as:

```
#include <stdlib.h>   /* required for rand_r(…) */
#include "buffer.h"

void *producer(void *param) {
        buffer_item rand;

        while (1) {
                /* sleep for a random period of time */
                sleep(…);

                /* generate a random number */
                rand = rand_r(…);
                if (insert_item(rand) < 0)
                        printf(…);       // report error condition
        }
}

void *consumer(void *param) {
        buffer_item rand;

        while (1) {
                /* sleep for a random period of time */
                sleep (…);

                if (remove_item(&rand) < 0)
                        printf(…); // report error condition
        }
}
```

5. **Thread creation** in the pthread package

The following code sample demonstrates the pthread APIs for creating a new thread:

#include <pthread.h>

void *thread_entry(void *param) {   /* the entry point of a new thread */
*   …*
}

int main(…) {
*   pthread_t tid;*
*   pthread_attr_t attr;*

*   /* get the default attribute */*
*   pthread_attr_init(&attr);*

*   /* create a new thread */*
*   pthread_create(&tid, &attr, thread_entry, NULL);*
*   …*
}

The pthread package provides *pthread_attr_init*(…) function to set the default attributes for the new thread. The function *pthread_create*(…) creates a new thread, which starts the execution from the entry point specified by the third argument.

6. **Mutex locks** in the pthread package

The following code sample illustrates how mutex locks available in the pthread API can be used to protect a critical section:

*   #include <pthread.h>*
*   pthread_mutex_t mutex;*

*   /* create the mutex lock */*
*   pthread_mutex_init(&mutex, NULL);*

*   /* acquire the mutex lock */*
*   pthread_mutex_lock(&mutex);*

*   /*** critical section ***/*

*   /* release the mutex lock */*
*   pthread_mutex_unlock(&mutex);*

The pthread package uses the *pthread_mutex_t* data type for mutex locks. A mutex is created with the *pthread_mutex_init*(&*mutex*, *NULL*) function, with the first parameter being a pointer to the

mutex. By passing *NULL* as a second parameter, we initialize the mutex to its default attributes. The mutex is acquired and released with the *pthread_mutex_lock*(…) and *pthread_mutex_unlock*(…) functions. If the mutex lock is unavailable when *pthread_mutex_lock*(…) is invoked, the calling thread is blocked until the owner invokes *pthread_mutex_unlock*(…). All mutex functions return a value of 0 with correct operation; if an error occurs, these functions return a nonzero value.

7.   **Semaphores** in the pthread package

The pthread package provides two types of semaphores - named and unnamed. For this project, we use unnamed semaphores. The code below illustrates how a semaphore is created:

> *#include <semaphore.h>*
> *sem_t sem;*
>
> */* create the semaphore and initialize it to 5 */*
> *sem_init(&sem, 0, BUFFER_SIZE*);

The *sem_init*(…) creates a semaphore and initializes it. This function is passed three parameters:

1. A pointer to the semaphore
2. A flag indicating the level of sharing
3. The semaphore's initial value

In this example, by passing the flag 0, we are indicating that this semaphore can only be shared by threads belonging to the same process that created the semaphore. A nonzero value would allow other processes to access the semaphore as well. In this example, we initialize the semaphore to the value 5.

For the semaphore operations wait (or down, P) and signal (or up, V) discussed in class, the pthread package names them sem_wait(…) and sem_post(…), respectively. The code example below creates a binary semaphore mutex with an initial value of 1 and illustrates its use in protecting a critical section: (Note: The code below is only for illustration purposes. Do not use this binary semaphore for protecting a critical section. Instead, you are required to use the mutex locks provided by the pthread package for protecting a critical section.)

> *#include <semaphore.h>*
> *sem_t sem_mutex;*
>
> */* create the semaphore */*
> *sem_init(&sem_mutex, 0, 1);*
> */* acquire the semaphore */*
> *sem_wait(&sem_mutex);*
>
> */*** critical section ***/*
>
> */* release the semaphore */*

sem_post(&mutex);

8. Compilation

You need to link two special libraries to provide multithreaded and semaphore support using the command "gcc <files> -lpthread -lrt" (without quotation marks).

9. Testing

You can start by using one producer thread and one consumer thread for testing, and gradually use more producer and consumer threads. For each test case, you need to make sure the random numbers generated by producer threads should exactly match the random numbers consumed by consumer threads (both their orders and their values).

Any program that does not compile will receive a zero. The grader will not spend any time to fix your code due to simple errors you introduce at the last minute. It is your responsibility to leave yourself enough time to ensure that your code can be compiled, run, and tested well before the due date.

10. Submission

Please make a lab2 directory and submit all files for this lab using the **submit** command, similarly to what was done on lab1. Please include a README file (with the name README exactly, with no extensions) for the grader with your full name and any instructions needed to compile and run your program. The submit directory for this class is c2431ae, and the name of this assignment is lab2. Please hand in a printout of your code and test cases in class.

A late penalty of 10% **per hour** will be assessed, for instance, if a lab is submitted at 12:00 am or 12:59 am the day after the due date, there is a 10% penalty. Labs must be the student's own work.

11. Additional Notes

Lab 2 is due *Monday, February 27th, 2017 at 11:59 pm*. The printout of code and test cases is due at the beginning of class on *Tuesday, February 28th*.

Adam Sturgeon and Luke Neff, the graders for the course, will be overseeing this lab and are available for questions, etc. Adam can be emailed at sturgeon.68@osu.edu and Luke can be emailed at neff.295@osu.edu.

You are welcome to use Piazza to discuss questions/problems you are having with the lab with other students. *Please do not post code.* You are also welcome to use information regarding Pthreads or

the Producer-Consumer problem that you may find on the Internet but, remember, *the lab must be your own individual work (do not look for or at, code for this problem on the Internet).*
